TITLE:

On Some Investigations of Russian Scientists on the Thermodynamics of Phase Equilibria

PERIODICAL:

Zhurnal fizicheskoy khimii, 1959, Vol 33, Nr 10, pp 2383 - 2386 (USSR)

ABSTRACT:

This article is intended to focus the attention of scientists concerned with the development of a theory of heterogeneous equilibria on several investigations of Russian scientists on this field (which have been forgotten, such as those by D. P. Konovalov and M. S. Vrevskiy). D. P. Konovalov's investigations of the thermodynamics of phase equilibria were written before Gibbs had devised his thermodynamic methods. Konovalov's laws, viz. his condition of stability may be derived directly from Gibbs' principle of equilibrium (Ref 4). Besides other significant results, D. P. Konovalov has successfully employed vapor-pressure measurement as a thermodynamic method for investigating phase equilibria. An important work on the thermodynamics of phase equilibria is the monograph by P. T. Pansal'skiy which was published in 1895 (Ref 8). In 1909 N. M. Vittorf (Ref 9) employed the geometrical method for plotting phase diagrams

Card 1/2

05846

SOV/76-33-10-44/45

from the curves of the thermodynamic potential, and plotted 100 kinds of diagrams for binary systems which still today serve as a source for phase diagrams of binary systems. Another important work constitutes R. P. Kholman's monograph (Ref 11) "On the Thermodynamics of Saturated Solutions" ("K termodinamike nasyshehennykh rastvorov") which gives a complete survey of the phase conditions of binary systems and establishes several rules. Some references are made to this book, and further a publication by A. V. Storokin (Ref 1) is mentioned. In 1913 G. A. Mazing (Ref 12) derived a set of differential equations defining the equilibrium of a two-phase multicomponent system. These equations were set up on the basis of Gibbs' general condition of thermodynamic equilibrium. Mazing carried out further investigations of thermodynamic problems. After brief reference to these studies, the author finally mentions publications by P. N. Pavlov (Ref 13), who dealt with the thermodynamics of surface phenomena. There are 13 Soviet references.

Replacement of chromed by vegetable-tanned parings and plant fibers in the manufacture of plastic leather. H. Ya. Kipnis. *Azhovskaya Khimiya* 19, 51 (1960); *Chem. Zvesti* 1936, 11, 1280 (u). In the production of artificial leather, parings from vegetable-tanned leather can be used without impairing the quality of the finished product so long as the products used have a fiber length not less than 8 mm. In many cases it is advisable to chrome the vegetable-tanned leather fibers so that they will better withstand the drying temps. The difficulty in completely replacing the chromed parings by vegetable-tanned leather waste lies in the lack of a method by which it is possible to free the fibers from lumps. M. G. M.

TITLE: Extrapolation of ^{2/}experimental thermal data to the region of ^{2/}high-pressure

SOURCE: Inzhenerno-fizicheskiy zhurnal, v. 10, no. 3, 1965, 374-381

TOPIC TAGS: high pressure, thermal analysis, propellant thermal property, heat quantity, equation of state, pressure effect, high pressure research

ABSTRACT: A method for extrapolating experimental data on the isothermal line to region of higher pressures was developed. For the calculation of extrapolated values, equations of state are recommended of which constants are determined from one of the last experimental points and from derivatives at this point. It is shown that errors in determining the constants which are mainly due to errors in the derivatives may be considerably reduced. Two equations of state, namely, Tait's equation and Biron's equation were examined. The Biron equation suggested here may be used for extrapolating thermal quantities of liquids and gases to a range of several thousand atmospheres. A method is given for determining the maximum pressure to which extrapolated values may be reliably applied. Orig. art. has: 3 figures, 15 formulas, and 4 tables. [Based on author's abstract] [RT]

TITLE: Semi-Automatic and Automatic Plasma Cutting of Aluminum Alloys¹ and
Stainless Steel

PERIODICAL: Svarochnoye proizvodstvo, 1960, No. 9, pp. 31-32

TEXT: Air-arc cutting or drilling-out of parts at a Soviet plant were replaced by mechanized cutting using the IMET-105 (IMET-105) plasma torch, designed by the Institut metallurgii imeni A. A. Baykova AN SSSR (Institute of Metallurgy imeni A. A. Baykov, AS USSR). Optimum cutting conditions were set up using a specially modified semi-automatic gas-cutting machine (Fig. 1). As the IMET-105 torch heated up very rapidly during the tests its design was modified as follows: the tungsten electrode holder rod was made of copper to ensure a better elimination of the heat; the contact surface of the welding cable connection with the tungsten electrode rod was enlarged; the welding cables of 50 mm² cross section were replaced by cables of 70 mm². After the aforementioned improvements had been brought about, the torch operation was stable without excessive heating of the current conducting parts. Optimum cutting speeds

TITLE: Apparatus for the automatic and semi-automatic cutting of aluminum alloys and stainless steel

PERIODICAL: Byulleten' tekhniko-ekonomicheskoy informatsii, no. 3, 1961, 24 - 25

TEXT: The author reports on investigations on the introduction of a mechanized cutting process of aluminum alloys and stainless steel with the aid of a special installation, which were carried at one of the enterprises of the Kalinin-grad Economic Rayon. The installation for the automatic or semi-automatic cutting is composed of the ПС -500 (PS-500) welding transformer; instrument cabinet with voltmeter, ammeter, pressure gage, intermediate relay, start button, transformer and contactor; special welding head, gas-cutting automatic of the coordinate or hinged type for the cutting of shaped parts by a copying device or gas-cutting semi-automatic for the cutting of straight parts by a guide rail; PK -53 (RK-53) oxygen reductor; hose for water and gas feed; control circuit line and ПРГД (PRGD) welding lines of 70 mm² cross section. The cutting of aluminum alloys and stainless steel is effected by fusing the metal and blowing it out from the hollow

of the cut by a gas discharge jet. To produce this jet an arc discharge is utilized excited between the tungsten electrode and the nozzle. Argon gas is conducted along the arc column, which, passing from the electrode to the nozzle, is ionized and emerges from the nozzle as a stable, luminous jet having a tapered shape, the dimensions of which depend on the design of the nozzle, current power, gas pressure and the recess of the electrode in the nozzle channel. The jet temperature attains 15.000°C and more. The introduction of the described mechanized cutting process reduces the labor consumption 13 times and cuts metal consumption by 30%. There is 1 figure.

I. L. Rogolberg and M. Kh. Rykova (Zavolzhskaya Laboratoriya, 1949, vol. 13, July, pp. 811-817). [In Russian]. The accuracy of the limits of solubility of binary metallic systems is discussed in terms of the accuracies of the determination of proportion and structure, of the chemical analysis, and of the measurement and regulation of temperature. It is concluded that most frequently the accuracy of the limits of solubility is controlled by the last of these. Some practical examples taken from intermetallic systems are given. - R. One necessary sign of correctness of the solubility limits in binary systems of metals. S. Kh. Kipnis and I. L. Rogelberg. *Doklady Akad. Nauk S.S.S.R.* 78, 701-3 (1961).—Calcs. of heat of soln. from soly. data are used to indicate accuracy of results. The heat of soln., Q , should vary continuously and monotonically with temp. unless some transition point is encountered. E.g., in the system Co-Cu, Q behaves normally with the exception of the region 1080-1070°, where Q rises sharply to a max., corresponding to a magnetic transformation in Co at 1048°. Other systems studied are Au-In, Bi-Mg, Al-Li, Au-Ge, Mg-Pb, Au-Al, and Au-Sn. In the system Bi-Mg, one value of Q is far off the regular curve; this indicates an error in the measurements of soly.
